TITLE: The Production of Glass in the Ukrainian SSR Must be Developed
(Razvivat' proizvodstvo stekla v USSR)
From the Technical Conference of Representatives of the Glass Industry
(S tekhnicheskogo soveshchaniya rabotnikov stekol'noy
promyshlennosti).

PERIODICAL: Steklo i Keramika, 1958, . . . Nr 2, pp. 43-45 (USSR)

ABSTRACT: This conference was called by the Ministry for the Industry of Building Materials of the Ukrainian SSR as well as by the Ukrainian- and Stalin-Regional NTO for Building Materials and took place on December 10-12, 1957 at Konstantinovka. The minister for the building material industry of the Ukrainian SSR, Moroz, opened the conference and stressed the fact that the production of glass must be increased. The following reports were further delivered:
1.) Patenko, (Deputy Minister for the Building Material Industry) spoke about the present stage of the glass industry, and pointed out what work must be carried out in future.
2.) Solinov (Director of the Institute for Glass) gave a report concerning new kinds of glass products for dwelling- and industrial buildings and how they are to be properly used in practice.

Card 1/5

The Production of Glass in the Ukrainian SSR Must be
Developed. From the Technical Conference of Representatives
of the Glass Industry

72-2-18/20

- 3.) Dubrovskiy (Director of the Ukrainian Branch of the Institute for Glass) described the work carried out by this institute.
- 4.) Tykachinskiy (Institute for Glass) gave a detailed description of the part played by the factors determining the intensity of the process of glass melting.
- 5.) Zhirnov ("Proletariy" plant) spoke about the success achieved by this plant.
- 6.) Lev (Representative of the Giprosteklo Institute) spoke about the distribution of new products.
- 7.) Alekseyev (Academy for Building and Architecture of the USSR) spoke about the assortment, quality, and value of building glass.
- 8.) Il'inskiy (Head of the Pyrometric Department of the Giprosteklo) spoke about the perfecting of glass smelting furnaces during future repair work.
- 9.) K.I.Borisov (PKB of the Institute for Glass) spoke about improved constructions of glass smelting furnaces and flues.

Card 2/5

The Production of Glass in the Ukrainian SSR Must be Developed. From the Technical Conference of Representatives of the Glass Industry

72-2-18/20

- 10.) Solomin, Professor (Institute for Glass) spoke about refractories for tank furnaces.
- 11.) Pronin (Lisichansk Works) reported about dinas products of high stability.
- 12.) Bondarev (Director of the "Avtosteklo" Works, Konstantinovka) dealt with prospects for building glass.
- 13.) Firer (Representative of the Gomel Plant) spoke about the production and use of glass tubes and foam glass.
- 14.) Zabkov (Director of the Plant imeni October Revolution) spoke about the prospects of the production of special glass products.
- 15.) Bashbeyk-Melikov (Scientific Collaborator of the Institute for Glass) gave a report on building glass blocks.
- 16.) Abakumov (Chief Engineer of the Skopino Works) spoke about the production of glass blocks in this plant.
- 17.) Shatokhin (Institute for Glass), Polik (Institute for Glass Fibres), Koryagina (Ivotzak Plant) spoke about glass fibres.

Card 3/5

The Production of Glass in the Ukrainian SSR Must be
Developed. From the Technical Conference of Representatives
of the Glass Industry

72-2-18/20

- 18.) Perederiyenko (Director of the Glass Works at Lvov) spoke about plate glass of high quality.
- 19.) Myasnikov (Dotsent of the Polytechnic Institute of Kiyev) spoke about the production of glass tiles.
- 20.) Resnikov (PKB of the Institute for Glass), Minakov ("Avto-steklo" Works, Konstantinovka), Dolbin ("Proletariy" Works), Kolesnikov (Plant imeni October Revolution), Zhirnov (TsKB MPSM Ukrainian SSR) spoke about problems of mechanisation.
- 21.) Pod'yel'skiy spoke about the packing of glass.
- 22.) Baklanov (Head of the Sovnarchosse Stalinsk) spoke about the development of new building materials in that province.
- 23.) Potanin (Deputy Chief of the Department for Building Materials of the Gosplan USSR) spoke about general problems of the glass industry.

Decisions were made with a view of increasing the efficiency and the quality of the products of glass works and the works producing

TITLE: The Application of Rare Earth Preparations in the Glass Industry
(Primeneniye v stekol'noy promyshlennosti preparatov redkikh zemel').

PERIODICAL: Steklo i Keramika, 1958, /5 Nr 2, pp. 21-24 (USSR)

ABSTRACT: Cerium dioxide can be used for the decolorization of glass, but, because of its high price, it is not used in a pure state. At present, however, cerium-dioxide-containing preparations are available at comparatively low prices. They are adulterated in different degrees by lanthanum-, neodymium-, praseodymium- and other oxides of rare earths (preparations КЛ-10). For the purpose of investigating the possibility of decolorizing glass by means of these preparations 3 types of glass were smelted as an experiment. The composition of these 3 types of glass is shown in table 1. L.G. Gurvits assisted in this work [Ref. 1]. The transparency of the glass samples was measured by means of the photometer МФТ-15. In their quality of glass decolorizing media preparations of arsenic- and antimony oxides, cerium dioxide, КЛ-10 and polirite were used. The cerium dioxide content in the preparations КЛ-10 and polirite is shown in table 4. The results obtained by the

Card 1/2

The Application of Rare Earth Preparations in the Glass Industry 72-2-8/20

glass-decolorization tests carried out by means of a mixture of antimony- and arsenic oxides are shown in table 2, those carried out with a cerium dioxide preparation in table 3, and those in which the preparations KII-10 and polirite were used are shown in table 4. The experiments are then described and explained in detail. As may be seen from fig. 1, polirite possesses the greatest polishing efficiency, and fig. 2 shows a comparison with other polishing media. Polirite substances already used can be used repeatedly. By the introduction of polirite in the plant Konstantinovka "Avtosteklo" the efficiency of the polishing process has been increased to 1.3-1.8 of its former extent. Some of the other rare earths compounds might also find suitable use in the glass industry: neodymium- and praseodymium oxides as coloring agents for light filters and artificial glass, lanthanum oxide for the production of high-efficiency refractories. There are 2 figures, 4 tables, and 4 references, 3 of which are Slavic.

TITLE:

Investigation of the Influence of Glass Polishing Accelerators by Means of Marked Atoms (Issledovaniye prirody deystviya uskoriteley polirovaniya stekla s pomoshch'yu mechenykh atomov)

PERIODICAL:

Staklo i keramika, 1959, Nr 7, pp 30 - 35 (USSR)

ABSTRACT:

Academician I. V. Grebenashchikov assumed in his paper (Footnote 1) that the acceleration of the glass polishing by means of crocus-suspensions containing electrolytes is caused by the fact that beside the glass hydrolysis the reactions of ion exchange between glass and the solutions are of great importance. The investigations of Yu. A. Gastev (Footnote 2) showed that the protective properties of the surface film on the glass are effected by the presence of calcium ions. V. A. Dubrovskiy in his former papers (Footnote 3) was of the opinion that the dissolution of the glass without the protective film is the basis of the glass polishing process. Therefore it must be assumed that the polishing intensity can be increased under conditions being favourable for the transition of calcium ions from the glass into the solution. For the purpose of examining these conditions the authors of this paper studied the transition of the calcium ions from the glass into the crocus-suspensions containing

Card 1/3

Investigation of the Influence of Glass Polishing Accelerators SOV/72-59-7-10/19
by Means of Marked Atoms

salts which retard or accelerate the polishing process according to investigations of N. N. Kachalov, V. G. Voano, A. I. Korelova (Footnote 4). Besides both the transition of iron ions from the crocus, the thickness of the iron silicate films forming in the course of the polishing on the glass surface and the absorption of iron ions by the glass were investigated. For the experiments vertically drawn glass marked with the radioactive isotope Ca⁴⁵, a radioactive solution of chlorine-Fe⁵⁹, and crocus obtained by burning a well washed ferric hydroxide at a temperature of 680° were used. The measurement of the radioactivity of the preparations was carried through by means of the radiometric standard apparatus of the type B with a front integrating apparatus TM-20. In the table the values of the remaining activity of the vertically drawn glass are given which was polished by means of suspensions of radioactive crocuses in water and electrolyte-solutions. From the paper by V. N. Simakov (Footnote 5) it may be seen that the silicic acid is the protection for the sol of ferric hydroxide. In a static condition of the powder the transition of calcium from the glass into the solutions of HCl, FeCl₃, AlCl₃, and polirite- and crocus-suspensions containing these

Card 2/3

Investigation of the Influence of Glass Polishing Accelerators SOV/72-59-7-10/19
by Means of Marked Atoms

electrolytes is represented in figure 1. In this connection the study of Yu. V. Rogoshin is mentioned. The test results in shaking the marked glass powder are given in figure 2. In figure 3 the transition of calcium- and sodium-ions from the glass into the solutions is represented in dependence of the pH of the medium. It may be seen from the investigations that beside the reactions of the ion exchange also other physicochemical factors must be taken into account for the interpretation of the nature of the acceleration effects. The investigations also showed that the composition of the surface protective film on the glass depends on the medium in which it has formed. There are 3 figures, 1 table, and 8 references, 6 of which are Soviet.

Soviet Science

Soviet Union

Soviet Union. 1960, No. 1, pp. 43-45 (1959).

Abstract: The All-Union Conference on the Structure of Glass was held in Moscow at the end of 1959. It was organized by the Institute of Glass and Glassware Materials Department of the Ministry of Light Industry (Minprom) (Chairman: V. I. Dubrovsky), the All-Union Chemical Society (Chairman: B. I. Smirnov) and the All-Union Optical Society (Chairman: S. I. Voronov). More than 300 reports on the structure of glass, investigation methods of the structure, the mechanism of crystallization and phase transitions and technical properties of glass were delivered. The Conference was opened by Academician A. N. Nesmeyanov.

At the Conference, 6 reports dealt with the structure of glass and 2 with the properties of glass and the differences between them and 4 reports with technical properties of glass.

V. I. Dubrovsky, V. A. Shchegolev and V. A. Kostylev reported on the structure of glasses. In their report, they analyzed the structure of glasses, the influence of temperature on the structure of glasses, the influence of pressure on the structure of glasses, the influence of the presence of impurities on the structure of glasses and the influence of the presence of water on the structure of glasses.

V. A. Kostylev reported on the influence of the structure of glass on its optical properties. He reported that the optical properties of glass depend on the nature of the substances and the temperature at which the glass was formed. V. A. Kostylev also reported on the influence of the structure of glass on its mechanical properties. He reported that the mechanical properties of glass depend on the nature of the substances and the temperature at which the glass was formed. V. A. Kostylev also reported on the influence of the structure of glass on its electrical properties. He reported that the electrical properties of glass depend on the nature of the substances and the temperature at which the glass was formed.

The importance of the structure of glass in the formation of the properties of glass and the nature of glass was discussed. V. A. Kostylev reported on the physical and chemical properties of glass. He reported that the physical and chemical properties of glass depend on the nature of the substances and the temperature at which the glass was formed. V. A. Kostylev also reported on the influence of the structure of glass on its physical and chemical properties. He reported that the physical and chemical properties of glass depend on the nature of the substances and the temperature at which the glass was formed.

V. A. Kostylev also reported on the influence of the structure of glass on its physical and chemical properties. He reported that the physical and chemical properties of glass depend on the nature of the substances and the temperature at which the glass was formed.

AUTHORS: Dubrovskiy, V. A., Guzhavin, O. V.

TITLE: The Influence of the Composition of Acid Baths on the Hardening of Sheet Glass

PERIODICAL: Steklo i keramika, 1960, No. 12, pp. 8 - 11

TEXT: Special investigations have been made regarding the rate of glass etching in mixtures of hydrofluoric acid and sulfuric acid. The experiments were conducted with glass from the Konstantinovskiy zavod "Avtosteklo" (Konstantinovka "Avtosteklo" Plant). The experimental results of the etching of vertically drawn glass within 15 min are shown in Fig.1. The rate of etching not only depends on the chemical composition of glass, but also on processes occurring in the acid baths. The influence of the composition and concentration of various acid baths on the strength of glass was established in experiments. The mechanical strength of glass in these and subsequent experiments was determined by symmetric bending. The experimental results of glass etching in acid mixtures show that the glass durability depends to a high degree on the chemical

composition of the glass. The bath $5.25\text{ N HF} + 6\text{ N H}_2\text{SO}_4$ warrants the highest rate of etching, best quality of the glass surface, and highest mechanical strength. The dependence of the strength of etched glass on the temperature of the acid bath is given in Table 2 and Fig. 4, and shows that the highest strength is obtained at a bath temperature of 24°C . The mechanical strength of glass can be increased by three methods: hardening, etching in acid-containing mixtures, and treatment in transformer oil. The greatest increase of glass strength can be obtained by the successive application of these three methods, i.e., by almost seven times, starting from polished glass. A strength of 100 kg/mm^2 was obtained for various samples. There are 4 figures and 3 tables.

Stepanov-Shubin, G.M. Torgov, V.A. Plotnikovskaya, A.K. Tschil'din; Ed. of Publishing House: I.V. Sverchadatel'naia, Tech. Ed.: V.P. Bocharov.

PURPOSE: This book is intended for researchers in the science and technology of glasses.

CONTENTS: The book contains the reports and discussions of the Third All-Union Conference on the Physics and Chemistry of Glasses, held on November 16-19, 1951. They deal with the methods and results of studying the structure of glasses, their relation between the structure and properties of glasses, the nature of the chemical bond and glass structure, and the crystallography of glasses. First, second and third order transitions, optical properties and glass structure, and electrical properties of glasses are discussed. Studies on the dependence of glass properties on composition, the lattice of glasses and radiation effects, mechanical, thermal and chemical properties of glasses. Other papers treat glass semiconductors and soda borosilicate glasses. The Conference was attended by more than 300 delegates from Soviet and East German scientific organizations. Among the participants in the discussions were V.N. Golitsyn, Ye. V. Kurnikova, Yu. Yu. Tsvetkov, G.R. Mikhaylov, A.M. Tarasov, D.L. Chetlin, G.P. Moshkovskiy-Petrushenko, G.P. Plotnikovskiy, A.Ye. Kusnetsov, E.Y. Dubtsevaya, G.V. Brusnitsyn, A.A. Kalinov, M.M. Skormina, P.V. Bobko, N.K. Waller, Yu.A. Kosolapov, V.P. Pelevin, R.B. Savchenko, Z. Sh. Plisker, and O.J. Malinovskaya. The final version of the Conference was addressed by Professor I.T. Kitaevskiy, Honored Scientist and Engineer Doctor of Technical Sciences. The following Institutes were cited for their contribution to the development of glass science and technology: Gosudarstvennyy opticheskiy institut (State Optical Institute), Institut kraslicheskogo filtratora Ak.SSR (Institute of Silicate Chemistry, AS USSR), Fizicheskiy institut im. S.A. Gorbunova (Polymer Institute AS USSR), Fiziko-tekhnicheskiy institut im. V.N. Zelenyi (Physico-Technical Institute of Physics, Academy of Sciences, Moscow), Nauka (Institute of Physics, Academy of Sciences, Leningrad), Tsentr nauchno-tekhnicheskikh issledovanii po sverchnym chislom (Center of Scientific Researches on Glass), Vsesoyuznyy in-t sredstv kachestva (VNIKS, Moscow), Vsesoyuznyy in-t zashchity i otsenivaniya kachestva (Institute of General and Inorganic Chemistry, Academy of Sciences, Moscow), Vsesoyuznyy in-t nauchno-tekhnicheskikh issledovanii po vysokim molekularnym soedineniyam (Institute of High Molecular Compounds, All Union), Rossiyskii gosudarstvennyy universitet (Russian Institute for Glass), Gidrometeorologicheskii in-t (Institute of Hydrometeorology), Nauka (Institute of Atmospheric Physics, Moscow), Rossishcheskii gosudarstvennyy tekhnicheskii institut (Institute of Chemical Technology), Leningradskii tekhnicheskii institut po i︠zucheniiu (Institute of Chemical Technology), Stroitel'stechiya (Stroytechiya), Lenkoran' (State Institute of Glass), Leningradskii gosudarstvennyy institut elektrotekhnicheskogo stekla (State Institute for Electrical Glass), Biblioteka fiziko-tekhnicheskikh nauch (Scientific Library of the Physico-Technical Institute), Leningradskii gosudarstvennyy universitet (Leningrad State University), Matematicheskii kiberneticheskii in-t (Institute for Mathematics), Tekhnicheskii in-t (Institute of Technology), Leningradskii gosudarstvennyy in-t po radiofizike i radioelektronike (Institute of Radiophysics and Radioelectronics), Belorusskii politeknicheskii in-t (Belarusian Polytechnical Institute), Belorusskii gosudarstvennyy in-t po radiofizike i radioelektronike (Belarusian Institute of Radiophysics and Electronics), and Byelorusskyy politekhnicheskyy institut (Byelorussian Polytechnic Institute). The Conference was sponsored by the Institute of Elastica Chemistry AS USSR (Act. Director - A.I. Gotlib), the Vsesoyuznoye mineralogicheskoye obshchestvo im. D.I. Mendeleeva (All-Union Chemical Society, I. M. Gorbunov), and the Gosudarstvennyy ordona Lenina opticheskiy institut (Inst. S.I. Vertikova).

S.I. Vertikov (State "Order of Lenin" Optical Institute) is the Chairman of the Conference. The 15 resolutions of the Conference include recommendations to organize a Center for the purpose of coordinating the research on glass, to publish a new journal under the title "Vestn. 1 dalyayashchiy" (Physics and Chemistry of Glass), and to join the International Committee on Glass. The Conference was also addressed by Academician N.N. Kurnikova, Professor, and Chairman of the Organization of the Organizational Committee, and Ye.A. Stepanov-Shubin, Profesor of Physics and Mathematics, Member of the Organizational Committee, and R.N. Myller, Doctor of Chemical Sciences, Member of the Organizational Committee. The editorial board thanks D.M. Matveyev, N.P. Vol'menzyan, L.I. Denikina, D.P. Dobrynin, S.E. Dubrovskiy, V.A. Toffe, and B.Z. Polomlyatz. References accompany individual reports.

- of buildings for experimental nuclear power plants. The paper was prepared by the Institute of Nuclear Power Engineering, Ministry of the USSR for the construction of nuclear power plants. It was published in Moscow in 1962.
- The paper describes the design of the reactor installation, except for the reactor itself.

The paper studied existing and proposed reactor installations. The study was based on the experience of the experimental nuclear reactor installations. The purpose of the paper was to establish the standardization of the elements of the reactor installations. Requirements for the installations for the experimental reactors of this type of construction are specified.

TITLE: Rock concrete shield against gamma radiation

SOURCE: Atomnaya energiya, v. 20, no. 5, 1966, 425-426

TOPIC TAGS: reactor shielding, concrete, gamma radiation

34
B

ABSTRACT: This is an abstract of article no. 80/3549, submitted to the editor and filed, but not published in full. It is proposed that rock concrete, which is made up of rocks embedded in a layer of a concrete mixture, has certain economic and technical advantages over ordinary concrete. To check on its properties, blocks were made of both concrete (specific weight 2250, 3300, and 4500 kg/m³), and rock concrete, containing limestone and hematite ore rocks, and having a specific weight 2320, 3770 and 4600 kg/m³. The experiments were made with gamma rays from a Co60 source (activity 500 gram equivalent of radium). The shielding properties of the rock concrete were calculated under the assumption that it is a homogeneous mixture of its chemical element, using the same calculation procedure

Card 1/2

UDC: 621.039.538.7

L 06980-67

ACC NR: AP6018356

as for concrete (based on the chemical composition). The test results agreed with the calculations, and it is concluded that rock concrete shields can be designed in the same manner as concrete shields. Orig. art. has: 1 figure.

TITLE: Passage of gamma radiation through seams of assembled concrete shields

SOURCE: Atomnaya energiya, v. 20, no. 5, 1966, 426-427

TOPIC TAGS: reactor shielding, gamma radiation, radiation dosimetry/SBM-10
gamma counter

ABSTRACT: This is an abstract of article no. 81/3550, submitted to the editor and filed, but not published in full. In view of lack of data on the shielding properties of assembled shields, and in view of the lack of well founded methods of calculating the passage of gamma rays through screens, the authors propose as a basic criterion for estimating the shielding efficiency a coefficient equal to the ratio of the integral or maximal dose intensities behind the assembled screen and an equivalent monolithic shield. An expression is proposed for this coefficient and its validity was tested with a cobalt source of activity 500 gram equivalent of radium in two source geometries (collimated and isotropic source). The

Card 1/2

UDC: 621.039.538.7

L 06981-67
ACC NR: AP6018357

counter used (SBM-10) had a much smaller diameter (0.6 cm) than the width of the seam, so that it could be regarded as pointlike. The experiments have demonstrated that the use of assembled shields does not lead to an appreciable local rise of the dose intensity behind the screen. The passage of the gamma radiation through the seams is described sufficiently well by the proposed formula. The effect of the seam can be compensated by increasing the shield thickness or by decreasing the seam length through the use of an assembly consisting of several layers. Orig. art. has: 2 formulas.

TITLE: Effect of neutron irradiation on certain properties of refractory concretes

SOURCE: Atommaya energiya, v. 21, no. 2, 1966, 108-112

TOPIC TAGS: concrete, refractory product, neutron irradiation, reactor shielding, reactor neutron flux, irradiation damage

ABSTRACT: This is a continuation of earlier research on the use of refractory concrete in reactor construction (Atommaya energiya v. 19, 524, 1965), where it was concluded that lack of data on the radiation endurance of concrete is the only obstacle to its use for shielding against intense radiation fluxes. The present article presents neutron-irradiation data on chromite refractory concrete made with portland cement and liquid glass. The concrete, in the form of briquettes 15 mm high and 15 mm in diameter, was tested in an integral neutron flux (2-2.4) x 10²¹ neut/cm² at an irradiation temperature up to 550C. The effect of the irradiation damage was examined visually and also by measuring the change of weight and dimensions, the change in the coefficient of thermal conductivity, and the change in the strength and elastic properties. It is concluded that the concrete samples retain sufficiently high strength and elas-

Card 1/2

L 10332-67

ACC NR: AP6029798

6

ticity, nor do noticeable changes take place in the thermal conductivity and in the coefficient of thermal expansion. This makes the material suitable for thermal shielding of nuclear reactors. Work on the influence of irradiation on the shrinkage and setting of the concrete and other strength characteristics are being presently continued. The authors thank A. N. Komarovskiy for suggesting the research, and A. M. Vorob'yev, V. F. Gulyayeva, M. Ya. Kulakovskiy, P. G. Pinchuk, and V. I. Savitskiy for help with the work. Orig. art. has: 3 figures and 3 tables

TITLE: Shielding property of heat resistant chromite and magnesite concretes

B

SOURCE: Atomnaya energiya, v. 21, no. 4, 1966, 293

TOPIC TAGS: nuclear shielding, nuclear reactor shield, neutron shielding, concrete

ABSTRACT: A comparative experimental study was made of the shielding property of ordinary concrete and of chromite-and magnesite-base concretes. Experiments were carried out in a VVR-Ts reactor of the Karpov Physicochemical Institute. The experimental relaxation distance data for gamma-radiation showed that heat-resistant chromite and magnesite concretes, even dehydrated, were good shielding materials and may be recommended for use in the thermal shield of the reactors at 800—1700C. Orig. art. has: 1 table.

pp. 47-54

TEXT: The author describes the recording and processing methods, and presents results from the analysis of short-periodical fluctuations since beginning of 1956 to the middle of 1958. Pc-type fluctuations have the maximum probability of appearance at local midday. The maximum of appearance of PcR falls in by 3 hours earlier, i. e., at 5 o'clock of universal time. Pt-type perturbations have highest probability of appearance at local midnight and are practically absent in the daytime. The regularities in the diurnal course of the fluctuations of both type are independent of the season. The probability of appearance of short-periodic fluctuations has a maximum in summer. The frequency spectrum of fluctuations was obtained. For Pc, the main interval is 20-25 sec, for PcR it is

15-20 sec, and for Pt it is 55-60 sec. 46 events of beat-type fluctuations (PP) with periods of 1.5-20 sec were recorded in the period from June 1957 to September 1958. Their maximum falls in the nightly hours. It is noted that the PP-type perturbations with amplitudes greater than 1 mv/km are connected with polar lights which permeate into the lower latitudes. There are 9 references.

TEXT: Displacement patterns in the time between outbreaks of magnetic
and ionospheric storms, D_{st} ($\Delta f_c F2$)-variations at the time of magnetic

and the probability distribution of $\Delta f_c F2$ on magnetically-quiet and
magnetically-disturbed days are examined from the data of ionospheric and
magnetic observations at Moscow and Ashkhabad for the period 1952 - 1958.
Ionospheric storms were only accompanied by magnetic storms in 55% of the
cases at Moscow (largely negative ones) and in 34% of the cases at

Ashkhabad (both positive and negative ones). The time displacement between magnetic and ionospheric storms depends on the local time of outbreak of the magnetic storm. If a magnetic storm starts in daylight hours, then, owing to the presence of the "forbidden" time of the day for the outbreak of ionospheric storms, the latter only begin after sunset. If a magnetic storm has started in the evening, night, or morning, the ionospheric storm either begins simultaneously with the magnetic storm or after some delay, but, nevertheless, before sunrise. The outbreaks of an ionospheric storm in relation to a magnetic storm are most retarded if the magnetic storm starts immediately after sunrise and least retarded if it begins before sunset. The distribution of values of $\pm \Delta f_{F2}$ for magnetically-quiet days approximates to the Gauss law; for magnetically-disturbed days the distribution curve changes at the expense of the increased probability of the appearance of large negative Δf_{F2} values for Moscow and Δf_{F2} values of both signs for Ashkhabad. It follows from the $D_{st}(\Delta f_{F2})$ -variations that maximum negative ionospheric

Rapid geoelectric and geomagnetic variations ...

ility for pc disturbances were observed in 1958. The probability of arising pc disturbances during the summer months is 1.5 - 2 times greater than during the winter. During a magnetically disturbed days it is 10% higher than during quiet days. pc_1 with $T \sim (20 : 25)$ sec and pc_2 with $T \sim (15 : 20)$ sec are most frequent. pt variations arise mainly during the night with a maximum (18%) at local midnight. Maximum pt number was observed in 1958 and the probability of their appearance is greater in summer than in winter. $T \sim (55 : 60)$ sec is most characteristic of pt. Variations of pp type were recorded from July 1957 to March 1959 in 66 cases; 60 of them were observed during magnetic storms. pp with $T (1-2)$ sec, occur most frequently. The diurnal distribution of pp is characterized by their maximum recurrence during the night. b disturbances have analogous diurnal distributions; however, from 42 b-cases only 3 were accompanied by pp, and 27 b were accompanied by pt. Intensive pp were observed in Ashkhabad during aurorae polaris, which were instrumentally registered. ssc have usually the following signs on magnetograms: H_+ , D_- , Z_- . The vector of telluric currents is in this case strictly polarized and oriented at an angle of $12^{\circ}5$ to the east-west direction. ssc are accompanied by associated variations with $T \sim (6 : 15)$ sec and 2 - 5 minutes duration.

On the morphology of magneto-ionospheric...

viation from the monthly sliding median of the criticol frequency ($f_{o}F2$) was taken.
For magnetic disturbances with a gradual commencement (GC) in Moscow the fraction of negative ionospheric disturbances is much higher than in Ashkhabad. For positive ionospheric disturbances the opposite was true. The fraction of ionospheric disturbances connected with geomagnetic storms with a sudden commencement (SC) both in Moscow and in Ashkhabad is higher than for GC magnetic storms. The correlation between magnetic storms and solar activity is investigated. The clearest correlation is for SC-type magnetic storms. Only negative ionospheric disturbances caused by SS-type magnetic storms can be closely correlated with the 11-year cycle of solar activity. The conclusions are: a) at medium latitudes negative ionospheric disturbances are caused by direct action of corpuscular streams on the upper atmosphere. b) positive ionospheric disturbances at medium latitudes are in most cases not

Some regularities in the diurnal, seasonal, and latitudinal distribution of magneto-ionospheric disturbances

PERIODICAL: Geomagnetiz i aeronomiya, v.2, no.4, 1962, 737-745

TEXT: Deviations in f_{0F2} , as recorded hourly in the USSR and India from 1952 to 1953 (minimum solar activity) and from 1957 to 1959 (maximum activity), and the magnetic characteristics of these same regions were used for the analysis of the latitudinal, diurnal and seasonal distribution of magneto-ionospheric disturbances. The geomagnetic disturbance is proportional to the geomagnetic latitude of the observation point. The geomagnetic latitudes from 30 to 40° constitute the boundary zone between the middle-latitude and the equatorial distributions of the ionospheric disturbances. There are two categories of ionospheric disturbances: 1) magneto-ionospheric characterized by correlation with the geomagnetic activity

S/203/62/002/004/013/018
1046/1242

Some regularities in the diurnal...

level and the geomagnetic latitude of the observation point, by a decrease in Δf_0F2 for all latitudes (the maximum being attained in the polar region and the minimum on the equator), and by a maximum disturbance during the equinoxes and a minimum in winter; 2) ionospheric disturbances on magnetically quiet days characterized by positive Δf_0F2 values, increased disturbance at low latitudes, seasonal independence in low latitudes and a winter maximum in high and middle latitudes. The clear positive correlation between the magneto-ionospheric disturbances and the geomagnetic activity level points to the corpuscular origin of category (1) of ionospheric disturbances. The ionospheric disturbances on magnetically quiet days [category (2)] are linked with weak corpuscular solar radiation (low-energy corpuscular streams) and with purely ionospheric processes. There are 8 figures and 1 table.

TITLE: New trends in studying the structure of the crust and upper mantle by geophysical methods in Turkmenistan

SOURCE: International Geological Congress. 22d, New Delhi, 1964. Geologicheskiye rezul'taty prikladnoy geofiziki (Geological results of applied geophysics); doklady sovetskikh geologov, problema 2. Moscow, Izd-vo Nedra, 1965, 33-44

TOPIC TAGS: Earth crust, upper mantle, magnetotelluric survey, seismologic investigation, seismic wave, fault / TURKMENISTAN

ABSTRACT: The present paper summarizes the results of geophysical investigations of the Earth's crust and mantle performed since 1961 in the Epihercynian Kara-Kum platform and the folded Alpine region of Kopet-Dag. Magnetotelluric surveys and seismological investigations were conducted along a 110-km submeridional profile extending between Ashkhabad and Balkardok. Several interfaces were investigated in the area near Ashkhabad. A geological cross section along the profile showing the structure of the Earth's crust and the upper mantle down to 85 km has been prepared

Cord 1/2

from the geophysical data. The region lying between the Epihercynian platform and the geosyncline has been analyzed. The presence of lateral inhomogeneities in the mantle is noted. The presence of deep-seated faults is discussed, and their location and extent are determined. Orig. art. has: 1 figure.

ABSTRACT: Information on the structure of the Earth can be obtained by a magnetotelluric probing method of observation and interpretation of the recordings of various types of elastic waves, generated during natural earthquakes, and by studying the variations with different periods of the natural electromagnetic field of the Earth. This method is based on the study of the ratio of variations in the electric and magnetic components of the Earth's electromagnetic field.

ACC NR: AR6019884

Magnetotelluric probing stations provide the possibility of studying variations of the electromagnetic field during a period of 10 seconds to 24 hours. For improved seismological testing, it was very important to design equipment with an intermediate magnetic recording. An increased resolution of the recordings of the seismograph made it possible to use new inputs to determine the type and analysis of composite waves. Seismological observations and subsurface magnetotelluric probing in Turkmenistan proved the possibility of using both methods for studying sedimentary layers as well as the structure of the Earth's crust and the upper mantle down to depths of approximately 200--250 km. Dubovský, V. Remarks to my paper "On the theory of completely additive set functions and the corresponding integral under the integral sign".
Sov. Math. (Izv. Akad. Nauk SSSR), No. 1, p. 11-15, 1945. (Russian English translation).
The results of the author's paper are extended to the case of completely additive functions which are not necessarily bounded. The properties of the functions are extended to the case where the points of the domain do not necessarily contain the individual points of the domain. The author also discusses the theory of the Borel sets of a function and gives, showing the relations between them, the definition of sequences of set functions and the convergence of sequences of set functions.

Author : Dubrovskiy, V. M.

Title : Method of iterations

Periodical : Usp. mat. nauk, 9, No 3(61), 127-133, Jul-Sep 1954

Abstract : The author devotes the present article to an investigation of the method of iterations in its application to the equation of the type $x=f(x)$, where $f(x)$ is a monotonic continuous function increasing or decreasing. He considers also some cases where the function $f(x)$ is not monotonic. He notes that more general equation $F(x)=x$ can be reduced to the type $x=f(x)$. Seven references, 2 French (Fatou, Julia) and 5 USSR (e.g. D. I. Talianov, "Some problems in the theory of iteration of a rational function," DAN SSSR, 43, No 3, 1953 [sic]; N. M. ABSTRACT: A new model of an automatic electronic polarimeter produced at the Astronomical Observatory of Khar'kov University is described. The instrument has a revolving polaroid behind which a photomultiplier is placed. Measurement of polarization actually consists of measuring the amplitude of the variable component of the photocurrent. Amplification is made by direct current. The d-c amplifier is enclosed in a negative feedback which stabilizes the amplification. It is noted that the mean square of error is 1% of the measured polarization value. When measuring
